

**Amendments to the Claims:**

This listing of claims will replace all prior versions and listings of claims in the application:

**Listing of Claims:**

Claim 1. (Currently Amended) A portable communication terminal comprising:  
a plurality of dipole antennas adapted to simultaneously perform a same communication;

a plurality of balance/unbalance transformers (BALUNs), each BALUN being coupled to a single dipole antenna of the plurality of dipole antennas; and

phase control means for feeding power to each of the dipole antennas and for controlling respective phases of powers to be fed to the dipole antennas, wherein ~~a phase of a first current in a first antenna of the plurality of dipole antennas and a phase of second current in a second antenna of the plurality of dipole antennas~~ difference of phases of powers to be fed to the dipole antennas is controlled such that ~~an electromagnetic field fields~~ in the vicinity of a user's head ~~is reduced~~ cancel each other.

Claim 2. (Original) The portable communication terminal according to claim 1, further comprising:

power distribution ratio adjusting means for adjusting a distribution ratio of powers to be respectively fed to the dipole antennas.

Claim 3. (Previously Presented) A portable communication terminal comprising:  
a printed circuit board having a first surface and an opposing second surface, the printed circuit board being included within the portable communication terminal;

a speaker mounted upon the first surface of the printed circuit board; and  
a dipole antenna arranged on the second surface of the printed circuit board.

Claim 4. (Original) The portable communication terminal according to claim 3, wherein the dipole antenna is formed in an antenna pattern on an antenna board mounted on the printed circuit board.

Claim 5. (Original) The portable communication terminal according to claim 4, wherein the antenna pattern has a multi-layered pattern structure formed on the antenna board and folded at least one time.

Claim 6. (Currently Amended) A portable communication terminal comprising:  
a plurality of dipole antennas adapted to simultaneously perform a same communication and arranged on a surface of a printed circuit board included in the terminal, the surface being opposite to a surface of the printed circuit board to which a speaker is mounted;

a plurality of balance/unbalance transformers (BALUNs), each BALUN being coupled to a single dipole antenna of the plurality of dipole antennas; and

phase control means for feeding power to each of the dipole antennas and for controlling respective phases of powers to be fed to the dipole antennas, wherein ~~a phase of a first current in a first antenna of the plurality of dipole antennas and a phase of second current in a second antenna of the plurality of dipole antennas~~ difference of phases of powers to be fed to the dipole antennas is controlled such that ~~an electromagnetic field fields~~ in the vicinity of a user's head ~~is reduced~~ cancel each other .
